

### **Background Research Questions**

1. Do we need to account for mistakes made/inaccuracies within the data given?
2. Will the data provided for each report always be consistent, with little to no information missing in different cases?
3. Should we be following a specific type of process model?
4. Are there more types of reports than the examples given?

### **Potential Risk**

1. A risk for this project would be the very likely expansion of complexity that can occur for dealing with something as diverse as a vehicle. If multiple vehicle models are taken into account on one report, will the system still work correctly? Or will a report be generated correctly whether the report is from vehicle model A versus vehicle model B? Complexity will create higher risk in and of itself.
